

The Slider

I have made my object fairly simple but effective in ways of making it easier for people to scan their card on the scanner without having to take it out of the pocket which can be a pain for uni students who have heaps of cards and have to search through the many card they have. This also saves time for the overall interaction as the line of students waiting to get inside the hall is reduced significantly. The interaction of scanning the keycard on the scanner shouldnt be a lengthy process and with this "slider" object, it allows for the overall interaction process to be reduced and gives the student a better and quicker experience.
